

## 800G EPON Equipment Selection Guide for Local Area Networks

### Overview

EPON Network Planning & Deployment Guide A comprehensive guide to EPON network planning and deployment, covering network architecture design, OLT and Selec.

### Key Takeaways

Selecting 800G EPON equipment requires careful consideration of OLT/ONU types, optical splitters, transceiver modules, and network topology to ensure high-speed, reliable LAN performance.

### Core EPON Components

An EPON network consists of three main components: the Optical Line Terminal (OLT) at the central office, Optical Network Units (ONUs) at subscriber premises, and the Optical Distribution Network (ODN) connecting them . The OLT manages bandwidth allocation, data scheduling, and network management, supporting multiple PON ports, each connecting to multiple ONUs through passive optical splitters . ONUs vary by deployment scenario: SFU for single-family homes, HGU with routing/WiFi for residential broadband, MDU for multi-dwelling units, and SBU for small businesses .

### Optical Splitters and ODN Considerations

Optical splitters are critical passive components that distribute signals from the OLT to multiple ONUs. Key parameters include: split ratio (1:8, 1:16, 1:32, 1:64), operating wavelength (1310nm upstream, 1490nm downstream), insertion loss (e.g., 1:32  $\approx$  16.5–17.5 dB), and package type (plug-in, tray, or mini). The optical power budget—including OLT transmit power, splitter loss, fiber loss, connector loss, and ONU receiver sensitivity—directly affects network coverage and stability.

### 800G Transceiver Modules

For high-speed LAN backbones or aggregation layers, 800G OSFP transceiver modules provide flexible connectivity options: 800GE, 2x400GE, 4x200GE, and 8x100GE. These modules comply with IEEE 802.3 standards and the OSFP MSA, offering high port density and interoperability with other 100GE, 200GE, and 400GE interfaces. They are suitable for data centers, enterprise core/distribution layers, and service provider networks, supporting both front-end and back-end AI or high-performance computing applications.

### Selection Criteria

When selecting 800G EPON equipment for LANs, consider the following:

- **Port Types and Counts:** GE/FE, POTS voice ports, CATV RF interfaces, and high-speed 800G ports for aggregation.
- **Standard Compliance:** IEEE 802.3ah/av for EPON, OSFP MSA for 800G transceivers.
- **Management Methods:** OMCI, TR-069, and Ethernet OAM for monitoring and configuration.
- **Operating Environment:** Temperature range, EMI resistance, and reliability requirements.
- **Network Topology:** Split ratios, fiber lengths, and optical power budget to ensure coverage and signal integrity.

### Deployment Recommendations

- Use MDU or SBU ONUs for multi-user or enterprise environments to maximize port utilization.
- Choose split ratios based on subscriber density and optical budget; lower split ratios reduce insertion loss and improve signal quality.
- Deploy 800G OSFP modules in aggregation or core switches to future-proof LAN infrastructure and support high-bandwidth applications.
- Ensure compatibility between OLT, ONU, and transceivers to maintain network stability and simplify management.

By carefully evaluating these factors, network designers can build high-performance, scalable 800G EPON LANs that meet both current and future bandwidth demands.
