

Automatic switching of the last-level distribution box

Overview

Automatic changeover systems are designed to monitor and maintain continuous supply. Today's technology allows the supervision and control of an entire distribution system from a single controller, referred to as an automatic transfer switch (ATS) or automatic changeover. A primary distribution substation is the connection point of a distribution system to a trans-mission or a sub-transmission network. The core function of any distribution board is to allow individual circuits to draw power from correctly rated circuit breakers and for those circuits to be isolated without causing a. Eaton provides both automatic load transfer and feeder fault and overcurrent protection in a single pad-mounted switchgear unit with its Cooper Power™ series PST (Pad-mounted Source Transfer) switchgear package, a self-contained load transfer device. The PST switchgear represents the union of. Our distribution automation solutions enable consistent open-and-close operation for longer switch life and enhanced crew safety. Remote switching your distribution feeders has never been easier! We provide an on-the-switch (OTS) motor and gearbox option for group-operated AR (automation ready) air. The distribution board is a panel that houses the fuses, circuit breakers, and ground leakage protection units used to distribute electrical power to numerous individual circuits or consumer points.
