

Blackbody Cavity Fiber Optic High Temperature Sensor

Overview

According to the principle of blackbody radiation, the experimental exploration of high temperature optical fiber temperature sensor was carried out.

Key Takeaways

A novel sapphire fiber-optic high-temperature sensor has been designed and fabricated based on blackbody radiation theory. A blackbody optical fiber thermometer consists of an optical fiber whose sensing tip is given a metallic coating. The sensing tip of the fiber forms an isothermal cavity, and the emission from this cavity is approximately equal to the emission from a blackbody. With a temperature range up to 1350°C, they provide exceptional uniformity and high emissivity, making them ideal for calibrating sensors like thermal imagers, pyrometers, SWIR to. In this paper, we designed a transient optical high temperature measurement system. The system took blackbody cavity sensor together with optical fiber to receive the measured signal, here, the integrated emissivity model of the blackbody cavity. Fiber-optic high-temperature sensors are gradually replacing traditional electronic sensors due to their small size, resistance to electromagnetic interference, remote detection, multiplexing, and distributed measurement advantages. This paper reviews the sensing principle, structural design, and.

Article Content

High temperature optical fiber temperature sensor based on blackbody ...

According to the principle of blackbody radiation, the experimental exploration of high temperature optical fiber temperature sensor was carried out. The high temperature resistant calcium tungstate

Sapphire Fiber-optic Temperature Sensor Based on Black-body

The sapphire fiber-optic temperature sensor based on Black-Body radiation law, is a new technique of high-temperature measurement in extreme environment, which combines techniques of

Use of Blackbody Optical Fiber Thermometers in High Temperature

Blackbody sensors consist of a high-temperature optical fiber with an opaque cavity attached to the sensing tip. The spectral radiative flux detected at the end of the fiber is related to the temperature of

High-temperature sensor instrumentation with a thin-film-based

Thermal radiation emitted from such a blackbody cavity is transmitted via optical fiber to a remote place for detection. The operating principle, the sensor structure, and the fabrication process are described

Development of Sapphire Optical Temperature Sensing System Used

A sapphire optical fiber blackbody radiation sensor based on the high-temperature multilayer structure of wolfram and aluminum oxide has been developed. Through the analysis of

A schematic diagram for high-temperature blackbody

In this sensor, a zirconia single-crystal fiber (SCF) was fabricated using the Laser Heated Pedestal Growth (LHPG) method, and a thin layer of bismuth oxide was

Study on a transient optical fiber high temperature measurement system

The system took blackbody cavity sensor together with optical fiber to receive the measured signal, here, the integrated emissivity model of the blackbody cavity was established and the optimum

Optical Fiber Sensors for High-Temperature Monitoring: A Review

This paper reviews the sensing principle, structural design, and temperature measurement performance of fiber-optic high-temperature sensors, as well as recent significant

Nonlinearity Mechanism and Correction of Sapphire Fiber Temperature ...

temperature sensor is that sapphire fiber pyrometer is based on the blackbody radiation theory, the probe tip is high temperature sapphire fiber which is produced in a closed blackbody cavity ...

Application of the SSPM in sapphire fiber black-body cavity transient ...

Sapphire fiber blackbody cavity transient high temperature sensor based on a whole blank-body radiation theory was introduced, and blank-body cavity production and weak photoelectric

High-temperature sensor instrumentation with a thin-film-based

A novel sapphire fiber-optic high-temperature sensor has been designed and fabricated based on blackbody radiation theory. Metallic molybdenum has been used as the film material to develop the

A schematic diagram for high-temperature blackbody optical fiber sensor ...

In this sensor, a zirconia single-crystal fiber (SCF) was fabricated using the Laser Heated Pedestal Growth (LHPG) method, and a thin layer of bismuth oxide was sintered on the tip of the alumina...
