

Pre-embedded test cold joint

Overview

Ground-Penetrating Radar (GPR) is a non-destructive testing method that uses electromagnetic waves to detect changes in the structure of materials. We will review how structural engineers and quality control laboratories can utilize NDT methods to assess the quality and integrity of concrete on or around the cold joint. What is Cold Joint in. To resolve the issue of cold joints forming in concrete during the construction process, this study has developed a control system with visual prevention capabilities. By utilizing the improved YOLO11-LP license plate recognition system, we record license plate information and calculate the supply. A cold joint in concrete is an area or surface with a structural discontinuity caused by the delayed concrete pouring between two layers of concrete. The methodology employs a small impact hammer embedded with a piezoelectric element and a displacement receiver.
