What size wire should be used to tie optical cables

Overview

The size of the „8“ will be determined by the size and stiffness of the cable, but 2 to 4m is a common size. Use gentler options: Hook-and-loop, low-tension, and releasable ties protect fibers. Standards matter: Follow TIA-568, BICSI, NFPA 70, and UL requirements. Proper installation is crucial: Maintain bend radius, use. Fiber cable is designed to be pulled with much greater force than copper wire if pulled correctly, but excess stress on the cable may harm the fibers, potentially causing eventual failure. This method uses 2 optical fibers contained in a single fiber optic cable and physically connects to ports at each end which houses the transmitter and receiver in a single assembly. The most common variety is carbon steel with a zinc coating. The zinc coating provides cathodic protection (CP) to the steel, meaning that red rust is prevented even on the cut ends.
